Issue 20, June 2011 (L^AT_EX release 2011-06-27)

Scheduled L^AT_EX bug-fix release

This issue of L^AT_EX News marks the first bug-fix release of L^AT_EX 2_ε since shifting to a new build system in 2009. Provided sufficient changes are made each year, we expect to repeat such releases once per year to stay in sync with T_EX Live. Due to the excitement of T_EX's 25th birthday last year, we missed our window of opportunity to do so for 2010. This situation has been rectified this year!

Continued development

The L^AT_EX 2_ε program is no longer being actively developed, as any non-negligible changes now could have dramatic backwards compatibility issues with old documents. Similarly, new features cannot be added to the kernel since any new documents written now would then be incompatible with legacy versions of L^AT_EX.

The situation on the package level is quite different though. While most of us have stopped developing packages for L^AT_EX 2_ε there are many contributing developers that continue to enrich L^AT_EX 2_ε by providing or extending add-on packages with new or better functionality.

However, the L^AT_EX team certainly recognises that there are improvements to be made to the kernel code; over the last few years we have been working on building, expanding, and solidifying the `expl3` programming layer for future L^AT_EX development. We are using `expl3` to build new interfaces for package development and tools for document design. Progress here is continuing.

Release notes

In addition to a few small documentation fixes, the following changes have been made to the L^AT_EX 2_ε code; in accordance with the philosophy of minimising forwards and backwards compatibility problems, most of these will not be noticeable to the regular L^AT_EX user.

Font subsets covered by Latin Modern and T_EX Gyre The Latin Modern and T_EX Gyre fonts are a modern suite of families based on the well-known Computer Modern and ‘PostScript 16’ families with many additional characters for high-quality multilingual typesetting.¹

¹See their respective TUGboat articles for more information:
<http://www.tug.org/TUGboat/tb24-1/jackowski.pdf>

Information about their symbol coverage in the TS1 encoding is now included in `textcomp`'s default font definitions.

Redefinition of `\enddocument` Inside the definition of `\end{document}` the `.aux` file is read back in to resolve cross-references and build the table of contents etc. From 2.09 days this was done using `\input` without any surrounding braces which could lead to some issues in boundary cases, especially if `\input` was redefined by some package. It was therefore changed to use L^AT_EX 2_ε's internal name for this function. As a result, packages that modify `\enddocument` other than through the officially provided hooks may need to get updated.

Small improvement with split footnotes in `ftnright` If in the first column there is more than a full column worth of footnote material the material will be split resulting in footnotes out of order. This issue is now at least detected and generates an error but the algorithm used by the package is unable to gracefully handle it in an automated fashion (some alternatives for resolving the problem if it happens are given in the package documentation).

Improvement in `xspace` and font-switching The `xspace` package provides the command `\xspace` which attempts to be clever about inserting spaces automatically after user-defined control sequences. An important bug fix has been made to this command to correct its behaviour when used in conjunction with font-switching commands such as `\emph` and `\textbf`. Previously, writing

```
\newcommand\foo{foo\xspace}
... \emph{\foo}  bar baz
... \emph{\foo}, bar baz
```

would result in an extraneous space being inserted after ‘foo’ in both cases; this has now been corrected.

RTL in `multicol` The 1.7 release of `multicol` adds support for languages that are typeset right-to-left. For those languages the order of the columns on the page also needs to be reversed—something that wasn't possible in earlier releases.

<http://www.tug.org/TUGboat/tb27-2/tb87hagen-gyre.pdf>

The new feature is supported through the commands `\RLmulticolcolumns` (switching to right-to-left typesetting) and `\LRmulticolcolumns` (switching to left-to-right typesetting) the latter being the default.

Improve French babel interaction with varioref

Extracting and saving the page number turned out to be a source of subtle bugs. Initially it was done through an `\edef` with a bunch of `\expandafter` commands inside. This posed a problem if the page number itself contained code which needed protection (e.g., pr/4080) so this got changed in the last release to use `\protected@edef`. However, that in turn failed with Babel (bug report/4093) if the label contained active characters, e.g., a “:” in French. So now we use (after one failed attempt pr/4159) even more `\expandafter` commands and `\romannumeral` trickery to avoid any expansion other than what is absolutely required—making the code in that space absolutely unreadable.

```
\expandafter\def\expandafter#1\expandafter{%
\romannumeral
\expandafter\expandafter\expandafter
\z@
\expandafter \@cdr
\romannumeral
\expandafter\expandafter\expandafter
\z@
\csname r@#2\endcsname\@nil}%
```

Code like this nicely demonstrates the limitations in the programming layer of L^AT_EX 2_ε and the advantages that expl3 will offer on this level.
